

TITLE of the INVENTION

Compression of digital data and coding of the compressed data in order to protect them against transmission errors

TEXT of the ABSTRACT

The invention concerns a method of adjusting at least one parameter for the compression of data representing physical quantities, the compressed data then being coded according to a coding mode in order to protect them against transmission errors, characterised in that it includes, as from a required compressed data size (R_T), the steps of:

- determining (E2) at least one characteristic (S) of the coding mode,
- determining (E5, E6) an effective size (R) of the compressed data according to the required size and said at least one characteristic,
- adjusting at least one compression parameter (E7) according to the effective size.
